# face-recognition 1.3.0

Latest version

`pip install face-recognition` 

Released: Feb 20, 2020

Recognize faces from Python or from the command line

## Navigation

 [Project description](#) [Release history](#) [Download files](#)

 [Homepage](#)

## Statistics

## Project description

### Face Recognition

Recognize and manipulate faces from Python or from the command line with

the world's simplest face recognition library.

Built using [dlib](#)'s state-of-the-art face recognition

built with deep learning. The model has an accuracy of 99.38% on the [Labeled Faces in the Wild](#) benchmark.

This also provides a simple `face_recognition` command line tool that lets

you do face recognition on a folder of images from the command line!

`pypi` v1.3.0`build` passing`docs` passing

## Features

- [English](#)

Find all the faces that appear in a picture:

Input

Output

```
import face_recognition
image = face_recognition.load_image_file("your_file.jpg")
face_locations = face_recognition.face_locations(image)
```

## Find and manipulate facial features in pictures

Get the locations and outlines of each person's eyes, nose, mouth and chin.

Input

Output

[Join the official 2020 Python Developers Survey:](#)[Start the survey! ↗](#)

- [Python :: 2.7](#)
- [Python :: 3](#)
- [Python :: 3.5](#)
- [Python :: 3.6](#)
- [Python :: 3.7](#)
- [Python :: 3.8](#)

```
face_landmarks_list = face_recognition.face_landmarks(image)
```

Finding facial features is super useful for lots of important stuff. But you can also use for really stupid stuff

like applying [digital make-up](#) (think 'Meitu'):

Input

Output

## Identify faces in pictures

Recognize who appears in each photo.

Input

Picture contains  
"Joe Biden"

Output

```
import face_recognition
known_image = face_recognition.load_image_file("biden.jpg")
unknown_image = face_recognition.load_image_file("unknown.jpg")
```

📊 Join the official 2020 Python Developers Survey:

Start the survey! ↗

```
results = face_recognition.compare_faces([biden_encoding,
```

You can even use this library with other Python libraries to do real-time face recognition:

See [this example](#) for the code.

## Installation

### Requirements

- Python 3.3+ or Python 2.7
- macOS or Linux (Windows not officially supported, but might work)

### Installing on Mac or Linux

First, make sure you have dlib already installed with Python bindings:

- [How to install dlib from source on macOS or Ubuntu](#)

Then, install this module from pypi using `pip3` (or `pip2` for Python 2):

```
pip3 install face_recognition
```

📊 Join the official 2020 Python Developers Survey:

Start the survey! [↗](#)

## Installing on Raspberry Pi 2+

- [Raspberry Pi 2+ installation instructions](#)

## Installing on Windows

While Windows isn't officially supported, helpful users have posted instructions on how to install this library:

- [@masoudr's Windows 10 installation guide \(dlib + face\\_recognition\)](#)

## Installing a pre-configured Virtual Machine image

- [Download the pre-configured VM image](#) (for VMware Player or VirtualBox).

## Usage

### Command-Line Interface

When you install `face_recognition`, you get a simple command-line program

called `face_recognition` that you can use to recognize faces in a photograph or folder full of photographs.

First, you need to provide a folder with one picture of each person you already know. There should be one image file for each person with the files named according to who is in the picture:

 **Join the official 2020 Python Developers Survey:**

[Start the survey! !\[\]\(eafc244b53721dd1ec133f0772f70fc7\_img.jpg\)](#)

Next, you need a second folder with the files you want to identify:

Then in you simply run the command `face_recognition`, passing in the folder of known people and the folder (or single image) with unknown people and it tells you who is in each image:

```
$ face_recognition ./pictures_of_people_i_know/ ./unknown_pictures/unknown.jpg,Barack Obama
/face_recognition_test/unknown_pictures/unknown.jpg,unknown_person
```

There's one line in the output for each face. The data is comma-separated

with the filename and the name of the person found.

An `unknown_person` is a face in the image that didn't match anyone in your folder of known people.

## ADJUSTING TOLERANCE / SENSITIVITY

[Join the official 2020 Python Developers Survey:](#)[Start the survey! ↗](#)

the people in your photos look very similar and a lower tolerance value is needed to make face comparisons more strict.

You can do that with the `--tolerance` parameter. The default tolerance

value is 0.6 and lower numbers make face comparisons more strict:

```
$ face_recognition --tolerance 0.54 ./pictures_of_people_i_know/  
/unknown_pictures/unknown.jpg,Barack Obama  
/face_recognition_test/unknown_pictures/unknown.jpg,unknown_person
```

If you want to see the face distance calculated for each match in order to adjust the tolerance setting, you can use `--show-distance true`:

```
$ face_recognition --show-distance true ./pictures_of_people_i_know/  
/unknown_pictures/unknown.jpg,Barack Obama,0.378542298950611  
/face_recognition_test/unknown_pictures/unknown.jpg,unknown_person,0.611111111111111
```

## MORE EXAMPLES

If you simply want to know the names of the people in each photograph but don't

care about file names, you could do this:

```
$ face_recognition ./pictures_of_people_i_know/ ./unknown_pictures/  
Barack Obama  
unknown_person
```

## SPEEDING UP FACE RECOGNITION

Face recognition can be done in parallel if you have a computer with multiple CPU cores. For example if your system has 4 CPU cores, you can

📊 Join the official 2020 Python Developers Survey:

Start the survey! ↗

all your CPU cores in parallel.

If you are using Python 3.4 or newer, pass in a `--cpus` `<number_of_cpu_cores_to_use>` parameter:

```
$ face_recognition --cpus 4 ./pictures_of_people_i_know/
```

You can also pass in `--cpus -1` to use all CPU cores in your system.

## Python Module

You can import the `face_recognition` module and then easily manipulate

faces with just a couple of lines of code. It's super easy!

API Docs: <https://face-recognition.readthedocs.io>.

## AUTOMATICALLY FIND ALL THE FACES IN AN IMAGE

```
import face_recognition

image = face_recognition.load_image_file("my_picture.jpg")
face_locations = face_recognition.face_locations(image)

# face_locations is now an array listing the co-ordinates
```

See [this example](#) to try it out.

You can also opt-in to a somewhat more accurate deep-learning-based face detection model.

Note: GPU acceleration (via nvidia's CUDA library) is required for good performance with this model. You'll also want to enable CUDA support when compiling `dlb`.

```
import face_recognition
```

[Join the official 2020 Python Developers Survey:](#)[Start the survey! ↗](#)

```
# face_locations is now an array listing the co-ordinates
```

See [this example](#)

to try it out.

If you have a lot of images and a GPU, you can also  
[find faces in batches](#).

## AUTOMATICALLY LOCATE THE FACIAL FEATURES OF A PERSON IN AN IMAGE

```
import face_recognition

image = face_recognition.load_image_file("my_picture.jpg")
face_landmarks_list = face_recognition.face_landmarks(image)

# face_landmarks_list is now an array with the locations
# face_landmarks_list[0]['left_eye'] would be the location
```

See [this example](#)

to try it out.

## RECOGNIZE FACES IN IMAGES AND IDENTIFY WHO THEY ARE

```
import face_recognition

picture_of_me = face_recognition.load_image_file("me.jpg")
my_face_encoding = face_recognition.face_encodings(picture_of_me)[0]

# my_face_encoding now contains a universal 'encoding' of my face's
# features for comparison, just like what you can do with data!

unknown_picture = face_recognition.load_image_file("unknown.jpg")
unknown_face_encoding = face_recognition.face_encodings(unknown_picture)[0]

# Now we can see the two face encodings are of the same person
results = face_recognition.compare_faces([my_face_encoding], unknown_face_encoding)

if results[0] == True:
    print("It's a picture of me!")
```

 **Join the official 2020 Python Developers Survey:**

Start the survey! 

See [this example](#)  
to try it out.

## Python Code Examples

All the examples are available [here](#).

### Face Detection

- [Find faces in a photograph](#)
- [Find faces in a photograph \(using deep learning\)](#)
- [Find faces in batches of images w/ GPU \(using deep learning\)](#)

### Facial Features

- [Identify specific facial features in a photograph](#)
- [Apply \(horribly ugly\) digital make-up](#)

### Facial Recognition

- [Find and recognize unknown faces in a photograph based on photographs of known people](#)
- [Compare faces by numeric face distance instead of only True/False matches](#)
- [Recognize faces in live video using your webcam - Simple / Slower Version \(Requires OpenCV to be installed\)](#)
- [Recognize faces in live video using your webcam - Faster Version \(Requires OpenCV to be installed\)](#)
- [Recognize faces in a video file and write out new video file \(Requires OpenCV to be installed\)](#)
- [Recognize faces on a Raspberry Pi w/ camera](#)
- [Run a web service to recognize faces via HTTP \(Requires Flask to be installed\)](#)
- [Recognize faces with a K-nearest neighbors classifier](#)

[Join the official 2020 Python Developers Survey:](#)[Start the survey! ↗](#)

depending on a black box library, [read my article](#).

## Caveats

- The face recognition model is trained on adults and does not work very well on children. It tends to mix up children quite easy using the default comparison threshold of 0.6.

## Deployment to Cloud Hosts (Heroku, AWS, etc)

Since `face_recognition` depends on `dlib` which is written in C++, it can be tricky to deploy an app

using it to a cloud hosting provider like Heroku or AWS.

To make things easier, there's an example Dockerfile in this repo that shows how to run an app built with

`face_recognition` in a [Docker](#) container. With that, you should be able to deploy

to any service that supports Docker images.

## Common Issues

Issue: `Illegal instruction (core dumped)` when using `face_recognition` or running examples.

Solution: `dlib` is compiled with SSE4 or AVX support, but your CPU is too old and doesn't support that.

You'll need to recompile `dlib` after [making the code change outlined here](#).

Issue: `RuntimeError: Unsupported image type, must be 8bit gray or RGB image.` when running the webcam examples.

Solution: Your webcam probably isn't set up correctly with OpenCV. [Look here for more](#).

Issue: `MemoryError` when running `pip2 install face_recognition`

Solution: The `face_recognition_models` file is too big for your available pip cache memory. Instead, try `pip2 --no-cache-dir install face_recognition` to avoid the issue.

 Join the official 2020 Python Developers Survey:[Start the survey! ↗](#)

Solution: The version of `dlib` you have installed is too old. You need version 19.7 or newer. Upgrade `dlib`.

Issue: `Attribute Error: 'Module' object has no attribute 'cnn_face_detection_model_v1'`

Solution: The version of `dlib` you have installed is too old. You need version 19.7 or newer. Upgrade `dlib`.

Issue: `TypeError: imread() got an unexpected keyword argument 'mode'`

Solution: The version of `scipy` you have installed is too old. You need version 0.17 or newer. Upgrade `scipy`.

## Thanks

- Many, many thanks to [Davis King \(@nulhom\)](#) for creating dlib and for providing the trained facial feature detection and face encoding models used in this library. For more information on the ResNet that powers the face encodings, check out his [blog post](#).
- Thanks to everyone who works on all the awesome Python data science libraries like numpy, scipy, scikit-image, pillow, etc, etc that makes this kind of stuff so easy and fun in Python.
- Thanks to [Cookiecutter](#) and the [audreyr/cookiecutter-pypackage](#) project template for making Python project packaging way more tolerable.

## History

### 1.2.3 (2018-08-21)

- You can now pass `model="small"` to `face_landmarks()` to use the 5-point face model instead of the 68-point model.
- Now officially supporting Python 3.7
- New example of using this library in a Jupyter Notebook

 **Join the official 2020 Python Developers Survey:**

Start the survey! 

- Removed dependencies on scipy to make installation easier
- Cleaned up KNN example and fixed a bug with drawing fonts to label detected faces in the demo

### 1.2.1 (2018-02-01)

- Fixed version numbering inside of module code.

### 1.2.0 (2018-02-01)

- Fixed a bug where batch size parameter didn't work correctly when doing batch face detections on GPU.
- Updated OpenCV examples to do proper BGR -> RGB conversion
- Updated webcam examples to avoid common mistakes and reduce support questions
- Added a KNN classification example
- Added an example of automatically blurring faces in images or videos
- Updated Dockerfile example to use dlib v19.9 which removes the boost dependency.

### 1.1.0 (2017-09-23)

- Will use dlib's 5-point face pose estimator when possible for speed (instead of 68-point face pose estimator)
- dlib v19.7 is now the minimum required version
- face\_recognition\_models v0.3.0 is now the minimum required version

### 1.0.0 (2017-08-29)

- Added support for dlib's CNN face detection model via model="cnn" parameter on face detection call
- Added support for GPU batched face detections using dlib's CNN face detector model

 **Join the official 2020 Python Developers Survey:**

Start the survey! 

- Added `face_rec_from_video_file.py` to examples
- `dlib` v19.5 is now the minimum required version
- `face_recognition_models` v0.2.0 is now the minimum required version

### 0.2.2 (2017-07-07)

- Added `-show-distance` to cli
- Fixed a bug where `-tolerance` was ignored in cli if testing a single image
- Added `benchmark.py` to examples

### 0.2.1 (2017-07-03)

- Added `-tolerance` to cli

### 0.2.0 (2017-06-03)

- The CLI can now take advantage of multiple CPUs. Just pass in the `-cpus X` parameter where X is the number of CPUs to use.
- Added `face_distance.py` example
- Improved CLI tests to actually test the CLI functionality
- Updated `facerec_on_raspberry_pi.py` to capture in rgb (not bgr) format.

### 0.1.14 (2017-04-22)

- Fixed a `ValueError` crash when using the CLI on Python 2.7

### 0.1.13 (2017-04-20)

- Raspberry Pi support.

### 0.1.12 (2017-04-13)

- Fixed: Face landmarks wasn't returning all chin points.

 **Join the official 2020 Python Developers Survey:**

[Start the survey! !\[\]\(feabb98897b440bc8695a03336a6e2df\_img.jpg\)](#)

### 0.1.10 (2017-03-21)

- Minor pref improvements with face comparisons.
- Test updates.

### 0.1.9 (2017-03-16)

- Fix minimum scipy version required.

### 0.1.8 (2017-03-16)

- Fix missing Pillow dependency.

### 0.1.7 (2017-03-13)

- First working release.
